## Press Release

### **Azimut and Everton identify a continuous geophysical anomaly over a 1.7-km gold bearing trend at Opinaca**

**Azimut Exploration Inc.** (“Azimut”) and its partner **Everton Resources Inc.** (“Everton”) announce the results of a 30 line-kilometre induced polarization (IP) geophysical survey completed over the A Block on the Opinaca property in James Bay, Quebec.

The survey follows up on the discovery of a gold bearing trend along which selected samples returned values as high as 29.07 g/t Au and 50.9 g/t Au (press releases of November 21, 2005 and January 24, 2006).

The survey identifies a strong and continuous IP anomaly showing an excellent spatial correlation with the mineralized outcrops that define the 1.7-km long gold bearing trend. This IP anomaly also continues 1.2 km to the west and 0.5 km to the east for a total of 3.4 km. If related to gold mineralization, this IP anomaly could indicate the presence of an extensive mineralized zone. Two 700-m long parallel IP anomalies were also identified 300 m north of the 3.4-km anomaly.

The potential of these shallow depth IP anomalies will be thoroughly assessed by a surface rock sampling program that will start in late May. This will optimize the implementation of the diamond drilling program scheduled to begin in mid-summer.

The IP survey was conducted by TMC Geophysics of Val d’Or, Quebec, using a time-domain system and a 25-metre dipole-dipole array, N=1 to 6. The interpretation was performed by Gérard Lambert Géosciences of St-André-Avellin, Quebec.

Everton can earn an interest of up to 65% in the project upon the delivery of a bankable feasibility study. Everton is the operator. This press release was prepared by Everton and revised by geologist Jean-Marc Lulin, Azimut’s Qualified Person under NI 43-101.

Azimut is a mineral exploration company that reduces exploration risk by using leading edge targeting methods to discover major deposits.
